

Pedro Pais

Gameplay & Multiplayer Programmer

Portugal | pgpaisdev@gmail.com | pgpais.com
github.com/pgpais | linkedin.com/in/pgpais

Profile

Gameplay programmer specializing in **multiplayer**, cooperative and asymmetric games using **Unity** and **Godot**. Experienced in gameplay systems, networking and rapid prototyping, with **published research** in game design and accessibility. Passionate about creating systems that encourage meaningful player interaction.

Technical Skills

Languages: C#, GDScript, TypeScript, Java

Engines: Godot 4, Unity

Networking: Godot Multiplayer API, Steamworks, Photon, Firebase

Areas: Gameplay Systems, Multiplayer Architecture, AI, UI Programming, Rapid Prototyping

Selected Projects

Noise Panic

2025 – Present

Godot 4, C#, Steamworks, Multiplayer

- Developing a 3D cooperative roguelike featuring **asymmetric player roles**, with separate gameplay systems for ship management and planetary exploration.
- Designing **gameplay systems for two asymmetric player roles**, ship crew and surface explorers, requiring synchronized interactions across independent but interdependent experiences.
- Designing and implementing a **server-authoritative multiplayer architecture** with delegated authority for player-controlled objects, ensuring smooth and synchronized gameplay across clients.
- **Integrated Steamworks** features including lobby management, player authentication and multiplayer session flow through GodotSteam.
- Developing enemy AI and navigation systems while building modular gameplay systems to support future content and mechanics.

Koala Boutique

2021

Unity, C#, Firebase

- Designed and implemented the **complete gameplay codebase** for an **asymmetric cooperative game** where each player experiences a distinct gameplay loop.
- Built an **event-driven synchronization architecture** using Firebase listeners to keep two independent gameplay experiences synchronized in real time.
- Developed gameplay systems including inventory, crafting, economy, progression, quests and shop.
- Extended the TopDown Engine with custom systems supporting the project's asymmetric cooperative gameplay.

Dextra

2020

Unity, C#

- Implemented the player controller and movement mechanics centered around the game's "turn right only" core mechanic.
- Designed **modular gameplay components** for hazards, collectibles and interactive objects using Unity's component-based architecture, enabling rapid creation of new gameplay elements.
- Developed reusable tools to streamline level creation and gameplay iteration.
- Worked closely with designers to prototype and iterate on puzzle mechanics, level layouts and overall game feel.

Education

University of Lisbon

2021

Nova School of Sciences and Technologies

- Specialized in Game Development and Human-Computer Interaction.

University of Lisbon

2022 – 2025

Doctorate in Informatics

- Completed three years of doctoral research focusing on cooperative game design, accessibility and player experience.

Game Design & Accessibility Research

- Published peer-reviewed research on cooperative game design, accessibility and player experience at **top-ranked Human-Computer Interaction (HCI) venues**, including **CHI** and **CSCW**.
- Research topics include **asymmetric cooperation, game accessibility, social play and inclusive game design**. Full publication list available on my portfolio website.

Game Jams

Participated in numerous game jams, rapidly designing and developing multiplayer and cooperative game prototypes within multidisciplinary teams.
